ABSTRACT

"BookMyDoc" is an Online Doctor Appointment Booking Web Application designed for efficient and user-friendly medical appointment scheduling. It provides a comprehensive list of doctors, their schedules, and availability within specific hospitals, empowering users to make informed decisions and book appointments conveniently. While initially focused on one hospital, the system offers potential expansion to multiple healthcare facilities.

The application includes three core modules: Admin, Doctor, and Patient, enabling seamless management of doctors, patient information, and appointments. Additional features include user registration, specialized doctor listings, and password reset. Non-functional requirements ensure robust performance, security, usability, availability, and regulatory compliance.

"BookMyDoc" simplifies healthcare access, reduces wait times, and enhances the overall healthcare experience for both doctors and patients.

This condensed abstract captures the key aspects of your project while keeping it shorter. If you have any further adjustments or specific points to emphasize, please let me know!

ACKNOWLEDGEMENT

We would like to express our sincere gratitude to everyone who has contributed to the completion of our project.

First and foremost, We would like to thank our project guide **Mrs. Rupali Thorat** mam for their constant guidance and support throughout the project. We extend our sincere thanks to our respected Centre Co-Ordinator **Mr. Rohit Puranik**, for allowing us to use the facilities available.

We would also like to express our appreciation to the faculty members of our department for their constructive feedback and encouragement. Their insights and suggestions have helped us to refine our ideas and enhance the quality of our work.

Furthermore, we would like to thank our families and friends for their unwavering support and encouragement throughout our academic journey. Their love and support have been a constant source of motivation and inspiration for us.

Thank you all for your valuable contributions to our project.

Mohan Talavar (233169)
Pranay Patil (233185)

1. Introduction:

1.1 Document Purpose:

This document serves as a comprehensive outline of the business requirements and the intended scope for the development of the Book My Doc System. The primary purpose of this document is to establish a clear delineation of both the functional and non-functional prerequisites, encompassing business regulations and other pertinent constraints.

1.2 Project Background:

In the wake of the pandemic, a global realization has emerged regarding the substantial influence of the internet. The field of medical services, in particular, has witnessed a remarkable surge in the generation of information on a daily basis. Relying on manual administrative processes for managing such information can give rise to a myriad of complications, leading to squandered time, financial resources, and human efforts. Moreover, conventional methods often entail prolonged waiting periods and intricate processing procedures before medical information is received. This project stands as a remedy to rectify such errors and eliminate the protracted waiting times. By doing so, it not only optimizes resource allocation but also endeavors to curtail expenditures and enhance overall efficiency.

1.3 Aim & Objectives:

The objective of the Online Doctor Appointment Booking Web Application is to provide users a convenient, efficient, and user-friendly solution for scheduling medical appointments. Our platform presents a comprehensive list of doctors, including their schedules and availability in specific hospitals. This empowers users to make well-informed decisions and seamlessly book appointments, eliminating the need for unnecessary visits. By minimizing such visits, our system enhances hospital efficiency, reduces wait times, and ensures a smoother experience for both doctors and patient.

2. Project Overview:

- Book My Doc System is the public web application used for one specific hospital.
- There are mainly three types of user.
- Admin will be able to register a new (recruited) doctor into the hospital system and will have access to all the details regarding appointment booking and patients taking treatment in the hospital.
- Patients can search and book appointments.
- Already registered patients can view further schedule, records, all related information regarding his/her treatment.
- Doctors can provide prescriptions to the consulting patients regarding medicines, lab tests, operations etc.

Book My Doc System provides such functionalities which connect doctor and patient with each other efficiently and it will reduce crowding in hospital.

3. System Analysis:

System analysis constitutes a vital phase of the development process, encompassing the gathering and interpretation of information, problem diagnosis, and formulation of improvement recommendations. It hinges on robust communication between system users and developers. System analysis represents a holistic view of the entire system, identifying inputs, and conducting an in-depth examination to pinpoint areas of concern. Proposed solutions are presented in the form of a comprehensive proposal, which is subject to review, and adjustments based on user feedback. This iterative process concludes upon user satisfaction with the proposal.

3.1 Existing System:

The current state of the doctor appointment booking system involves manual processes reliant on pen and paper. Adding new patients, scheduling appointments, and notifying users are managed through traditional methods:

User-unfriendly interface.

Secretary's direct involvement for notice dissemination and bill distribution.

Difficulty in congregating all society members in one location.

Paperwork maintenance for flat details and owners.

Time-consuming operations.

Limited accessibility for remote users.

3.2 Proposed System:

The envisaged system revolutionizes the doctor appointment booking process by introducing a user-friendly interface for all stakeholders. The system's features encompass cross-browsing capabilities, multilingual support catering to various demographics, and more. It accommodates the needs of diverse society members, even those residing abroad, ensuring global accessibility.

- Enhanced user interface for all society members.
- Multilingual support for wider inclusion.
- Accessibility for members regardless of their geographical location.
- Reduction of manual documentation.
- Online availability, facilitating 24/7 access.
- User-friendly web platform for smooth interactions.

4. STUDY OF THE SYSTEM

4.1 MODULES:

The system after careful analysis has been identified to be presented with the following modules and roles.

The modules involved are:

Book My Doc System consists of three modules described below.

1. Admin Module
2. Doctor Module
3. Patient Module

4.1.1 Admin Module:

- Admin can login.
- Admin can register a newly recruited doctor.
- Admin can also view the list of all the doctors and patients who are registered in the system.
- Admin can also view all details of doctors and patients and have authority to remove doctor as well as patient.
- Admin can also view all the appointment bookings of all the doctors.
- Admins have authority to give approval on patient's appointment cancellation request.

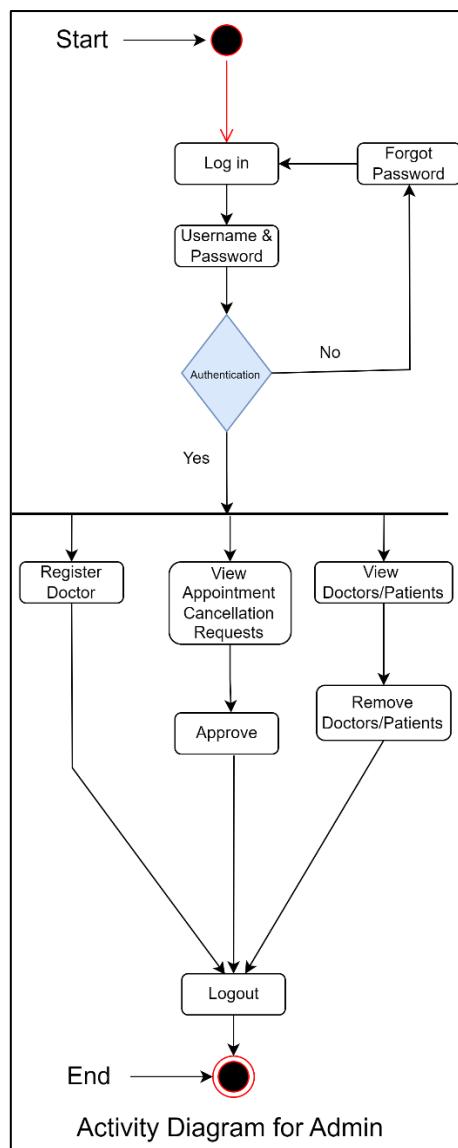

Fig 1. Activity diagram for Admin

4.1.2 Doctor Module:

- Doctor can login.
- A Doctor can add/modify his schedule of availability.
- He can view details of a revisiting patient.
- He can view the appointment schedule.

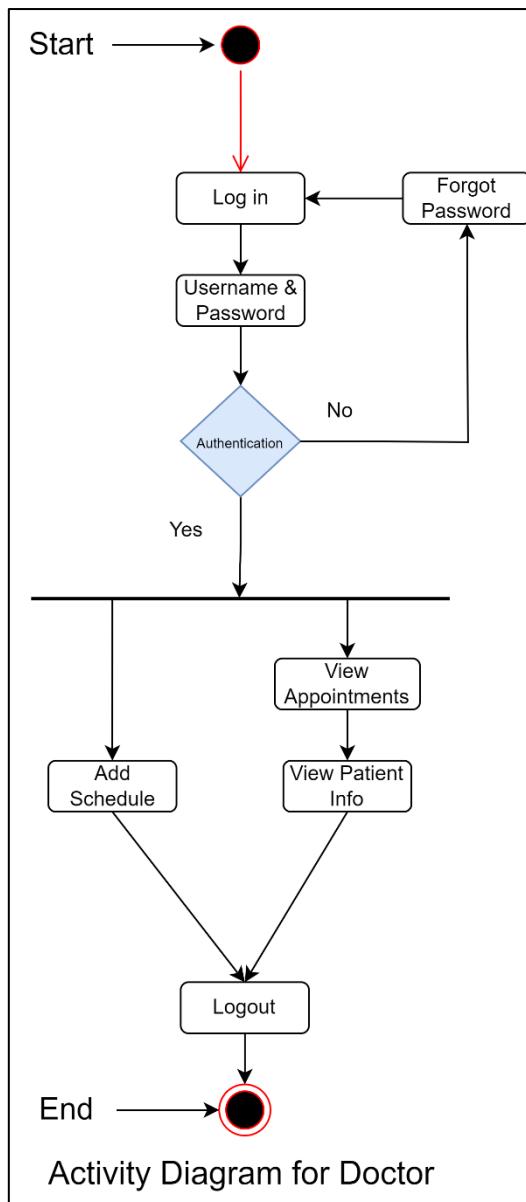

Fig 2. Activity diagram for doctor

4.1.3 Patient Module:

- A Patient can register and book an appointment.
- He can login into his profile once registered.
- He can book/cancel a appointment.
- A Patient can view the prescription given to him by the Doctor.
- He can upload his medical history documents or recent test reports for consultation.

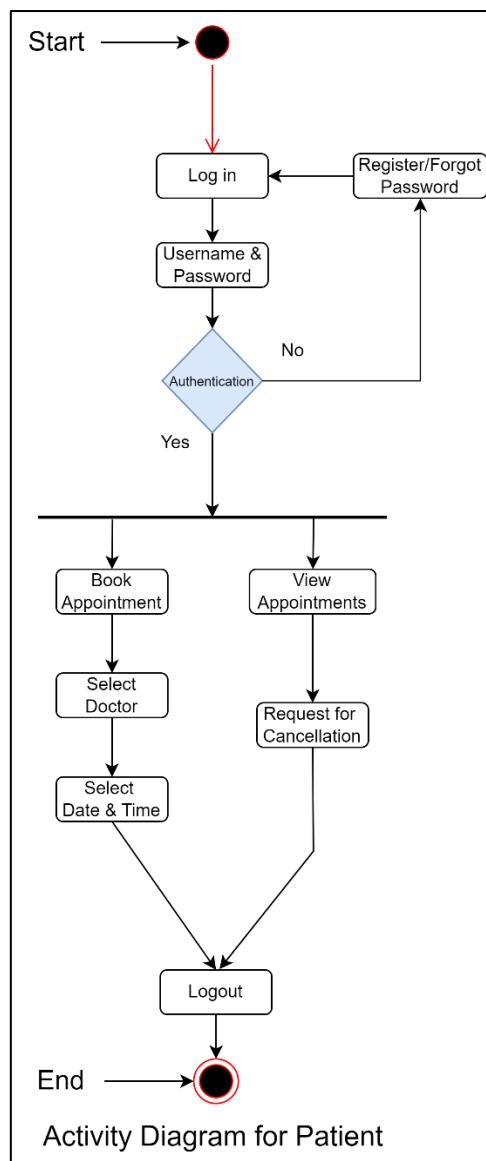

Fig 3. Activity diagram for patient

5. Software Requirement Specification

Document:

System Requirement Specification Document

Title:

System Requirement Specification for Online Doctor Appointment Booking Application

Objective (Purpose):

The objective of the Online Doctor Appointment Booking Web Application is to offer users a convenient, efficient, and user-friendly solution for scheduling medical appointments. Our platform presents a comprehensive list of doctors, including their schedules and availability in specific hospitals. This empowers users to make well-informed decisions and seamlessly book appointments, eliminating the need for unnecessary visits. By minimizing such visits, our system enhances hospital efficiency, reduces wait times, and ensures a smoother experience for both doctors and patients.

Scope:

This System is limited to offering a user-friendly solution for scheduling medical appointments and services exclusively within a single, chosen hospital. The application will empower users with the ability to access doctor information, schedules, and availability within the confines of this hospital, ensuring a seamless and informed booking experience. While presently focused on a specific hospital, the project's potential expansion to encompass multiple healthcare facilities remains a possibility for future iterations.

5.1 Functional Requirements:

The Doctor's Appointment System is composed of three distinct modules, each designed to serve a specific role within the application:

Admin Module:

- Admin can log in to the system.
- Admin can register a newly recruited doctor.
- Admin can view a comprehensive list of all registered doctors and patients.
- Admin possesses the authority to view detailed information about doctors and patients, as well as the capability to remove them.
- Admin can access and review the complete schedule of appointment bookings for all doctors.
- Admin is empowered to approve or reject patient appointment cancellation requests.

Doctor Module

- Doctors can log in to their accounts.
- Doctors have the ability to add or modify their availability schedules.
- Doctors can access details of revisiting patients to enhance personalized care.
- Doctors can view their own appointment schedules.

Patient Module

- Patients can register within the system and subsequently book appointments.
- Registered patients can securely log in to their accounts.
- Patients can initiate the booking and cancellation of appointments.
- Patients can access their prescribed treatment plans provided by the doctors.
- Patients can request password reset in case of forgotten credentials.

Additional Functionalities:

- User Registration and Login: Users can create accounts, log in securely, and access personalized profiles.
- Specialized Doctor Listing: Users can retrieve a list of doctors categorized by specialization.
- Forgot Password: Users can initiate the process of resetting their password in case it's forgotten.

5.2 Non Functional Requirements:

Performance:

- Response Time: The system should provide near-instantaneous response times for basic interactions such as viewing doctor lists and scheduling appointments.
- Scalability: The application should be able to handle increased user load without significant degradation in performance.

Security:

- User Data Protection: All sensitive user data, including personal and medical information, should be encrypted, and securely stored.
- Authentication and Authorization: User authentication and authorization should be implemented to ensure that only authorized individuals can access specific modules and functionalities.

Usability:

- User-Friendly Interface: The user interface should be intuitive and easy to navigate, catering to users of varying levels of technical expertise.
- Accessibility: The system should be designed to accommodate users with disabilities, adhering to accessibility standards.

Availability:

- Uptime: The system should aim for a high level of availability, minimizing downtime for maintenance or technical issues.
- Backup and Recovery: Regular backups of data should be performed, and mechanisms for quick data recovery in case of failures should be in place.

Compatibility:

- Cross-Platform Compatibility: The application should be compatible with various web browsers and operating systems to ensure a consistent user experience.
- Mobile Responsiveness: The system should be responsive and accessible across a range of mobile devices.

Reliability:

- Data Integrity: The system should ensure the accuracy and integrity of data, preventing data loss or corruption.
- Error Handling: Proper error handling mechanisms should be implemented to provide informative error messages and guide users in resolving issues.

Regulatory Compliance:

- Privacy Regulations: The system should comply with relevant privacy regulations and standards (such as GDPR or HIPAA) to safeguard patient data.

Performance Testing:

- Load Testing: The system should undergo load testing to determine its performance under various user load conditions.
- Stress Testing: Stress testing should be conducted to assess the application's stability under extreme conditions.

Maintenance:

- Maintenance Window: Scheduled maintenance should be communicated to users in advance, and the application should be brought down for maintenance during low-usage periods.
- Version Updates: The system should be designed with flexibility to accommodate future updates and enhancements.

6. SYSTEM DESIGN

System design is the solution for the creation of a new system. This phase focuses on the detailed implementation of the feasible system. Its emphasis on translating design specifications to performance specification. System design has two phases of development.

➤ Logical Design

➤ Physical Design

During logical design phase the analyst describes inputs (sources), outputs(destinations), databases (data stores) and procedures (data flows) all in a format that meets the user requirements. The analyst also specifies the needs of the user at a level that virtually determines the information flow in and out of the system and the data resources. Here the logical design is done through data flow diagrams and database design. The physical design is followed by physical design or coding. Physical design produces the working system by defining the design specifications, which specify exactly what the candidate system must do. The programmers write the necessary programs that accept input from the user, perform necessary processing on accepted data and produce the required report on a hard copy or display it on the screen.

6.1 INPUT AND OUTPUT DESIGN:

6.1.1 Input Design:

Input design establishes the crucial bridge between the Doctor's Appointment Booking System and its users, particularly in the context of MySQL database integration. This phase involves identifying the necessary input fields, validating the data, streamlining data entry, and accommodating multiple users. The prevalence of erroneous inputs underscores the significance of a robust input design. Such design curbs errors introduced during data entry by incorporating stringent validation mechanisms. User-generated inputs undergo transformation into a MySQL-compatible format, ensuring seamless integration.

Upon data collection, inputs are logically grouped, ensuring coherence. Corresponding MySQL data types are chosen to accommodate various input categories. Validation checks are performed on input data, and in cases where data fail to meet predefined criteria, users are promptly notified through informative messages. Data that successfully satisfy all conditions are subsequently mapped to appropriate tables within the MySQL database. Notably, the registration process for patient and doctor details is implemented in a user-centric manner, promoting usability and error mitigation.

6.1.2 Output Design:

In the context of MySQL integration within the Doctor's Appointment Booking System, output design takes center stage as a pivotal aspect. The generation of efficient and intelligible output becomes paramount. The quality of output significantly impacts user-system interaction and decision-making processes. Ensuring user engagement, the system offers sample output previews, acknowledging the user's role in evaluating output quality.

For this MySQL-integrated system, the output module predominantly encompasses selected notifications. These notifications, as the system's output, are meticulously structured to provide concise and relevant information to users. By leveraging the capabilities of MySQL's querying and data retrieval mechanisms, the system optimizes the generation of notifications, thereby enhancing the user experience and facilitating informed decision-making.

7. DATABASE DESIGN

7.1 DATABASE:

Databases are the storehouses of data used in the software systems. The data is stored in tables inside the database. Several tables are created for the manipulation of the data for the system.

Two essential settings for a database are

- Primary key - the field that is unique for all the record occurrences
- Foreign key - the field used to set relation between tables

Normalization is a technique to avoid redundancy in the tables.

7.2 SYSTEM TOOLS:

The various system tools that have been used in developing both the front end and the back end of the project are being discussed in this chapter.

7.2.1 FRONT END:

React is a library which is developed by Facebook are utilized to implement the frontend. React (also known as React.js or ReactJS) is a free and open-source front-end JavaScript library for building user interfaces or UI components. It is maintained by Facebook and a community of individual developers and companies. React can be used as a base in the development of single page or mobile applications. However, React is only concerned with state management and rendering that state to the DOM, so creating React applications usually requires the use of additional libraries for routing, as well as certain client-side functionality.

7.2.2 BACKEND:

The back end is implemented using MySQL which is used to design databases.

7.3 MySQL:

MySQL is the world's second most widely used open-source relational database management system (RDBMS). The SQL phrase stands for Structured Query Language.

7.4 Spring-Boot:

IACSD SMS.com [22] This is used to connect MYSQL and fetch data from database and store the data in database. The Spring Framework is an application framework and inversion of control container for the Java platform. The framework's core features can be used by any Java application, but there are extensions for building web applications on top of the Java EE (Enterprise Edition) platform. Although the framework does not impose any specific programming model, it has become popular in the Java community as an addition to the Enterprise JavaBeans (EJB) model. The Spring Framework is Open-source Framework.

16. CONCLUSION AND FUTURE SCOPE

- Book My Doc System provides a better platform to get connected with doctors and patients efficiently.
- Use of this system will be specific for one hospital or its franchises.
- Patients will be able to book an appointment 24 hrs prior to the schedule.
- Doctors will be able to provide their schedule at least for one week in advance.
- Booking options will be available 24 hours, 7 days. Doctors can modify their schedule at least 48 hours in advance.
